## Solutions

## Solution 1: CCD Image Processing

a) To measure instrumental magnitude we should choose an aperture. Careful investigation of the image, shows that a $5 \times 5$ pixel aperture is enough to measure $m_{I}$ for all stars. $m_{I}$ can be calculated using:

$$
m_{I}=-2.5 \log \left(\frac{\sum_{\mathrm{i}=1}^{\mathrm{N}} \mathrm{I}_{\mathrm{i}(\text { star })}-\mathrm{N} \overline{\mathrm{I}}_{\text {Sky }}}{\operatorname{Exp}}\right)
$$

where $I_{i(s t a r)}$ is the pixel value for each pixel inside the aperture, $N$ is number of pixels inside the aperture, $\overline{\mathrm{I}}_{\text {Sky }}$ is the average of sky value per pixel taken from dark part of image and Exp is the exposure time. Table (1.4) lists values for $m_{I}$ and $Z$ mag calculated for all three identified stars.

$$
\begin{gathered}
\overline{\mathrm{I}}_{\text {Sky }}=4.42 \\
N=25 \\
\text { Exp }=450 \\
\text { Table (1.4) }
\end{gathered}
$$

| Star | $m_{I}$ | $m_{t}$ | Zmag |
| :---: | :---: | :---: | :---: |
| 1 | -3.02 | 9.03 | 12.38 |
| 3 | -5.85 | 6.22 | 12.40 |
| 4 | -4.04 | 8.02 | 12.39 |

b) Average $\mathrm{Zmag}=12.4$
c) Following part (a) for stars 2 and 5 , we can calculate true magnitudes $\left(m_{t}\right)$ for these stars

## Table (1.5)

| Star | $m_{I}$ | $m_{t}$ |
| :---: | :---: | :---: |
| 2 | -2.13 | 9.93 |
| 5 | -0.66 | 11.4 |

d) Pixel scale for this CCD is calculated as

$$
\begin{gathered}
p=\frac{\text { pixel size }}{\text { focal length }} \times \frac{180 \times 3600}{\pi} \\
=4.30^{\prime \prime}
\end{gathered}
$$

e) Average sky brightness:

$$
\begin{gathered}
m_{s k y}=-2.5 \log \frac{\overline{\mathrm{I}}_{\text {Sky }}}{(E x p)(p)^{2}}+Z m a g \\
=20.6
\end{gathered}
$$

f) To estimate astronomical seeing, first we plot pixel values in x or y direction for one of the bright stars in the image. As plot (1) shows, the FWHM of pixel values which is plotted for star 3 , is 1 pixel, hence astronomical seeing is equal to

$$
\text { seeing } \cong 4 "
$$

Plot (1)

CCD Image Problem Marking Scheme

| Part | Tot. Pts. | Details | Max. | Explanation |
| :---: | :---: | :---: | :---: | :---: |
| a | 10 | Relation | 2 | $\begin{gathered} \text { Each value :+2 } \\ \bar{I}_{s k y}(\text { within calculation }):+2 \\ m_{I} \text { relation (in calculation) }+2 \end{gathered}$ |
|  |  | $m_{I}$ | 6 |  |
|  |  | $\bar{I}_{s k y}$ | 2 |  |
| b | 10 | $Z_{\text {mag }}$ | 10 | $3 Z_{\text {mag }}$ and average, for each less: - 2 |
| c | 10 | $m_{t}$ | 10 | For each one:+ 5, for each numerical mistake: -2 |
| d | 10 | P (pixel Scale) | 10 |  |
| e | 10 | Relation of $m_{s k y}$ | 5 |  |
|  |  | Value of $m_{s k y}$ | 5 |  |
| f | 10 | Seeing | 10 | Seeing: +4, Gaussian profile: +3, FWHM: +3 |

## Solution 2: Venus

a) The $\angle S V E$ angle should be calculated from the phase of Venus. Figure 2.1 shows that projected area of Venus disk which is illuminated by the Sun is

$$
\frac{\pi r^{2}}{2}+\frac{\pi r r^{\prime}}{2}
$$

where

$$
r^{\prime}=r \cos (\angle S V E)
$$

Then,

$$
\text { Phase }=\left(\frac{\frac{\pi r^{2}}{2}+\frac{\pi r^{2} \cos (\angle S V E)}{2}}{\pi r^{2}}\right) \times 100=\frac{100}{2}(1+\cos (\angle S V E))=100 \cos ^{2}\left(\frac{\angle S V E}{2}\right)
$$

The angle $\angle S V E$ is calculated and written in table 2.2, column 2.

Figure 2.1
b) As in figure 2.1, in $S E V$ triangle we have,

$$
\begin{gathered}
\frac{r_{e}}{\sin (\angle S V E)}=\frac{r_{v}}{\sin (\angle S E V)} \\
r_{v}=r_{e} \frac{\sin (\angle S E V)}{\sin (\angle S V E)}
\end{gathered}
$$

where $r_{e}$ and $\angle S E V$ (elongation) is given in table 2.1 then, $r_{v}$ for all observing dates is calculated and written in table 2.2 column 3.
c)

d) According to the obtained values written in table 2.2 column 3 ,

$$
\begin{aligned}
r_{v}^{\max } & =0.728 A U \\
r_{v}^{\min } & =0.718 A U
\end{aligned}
$$

e) Semi-major axis is

$$
a=\frac{\left(r_{v}^{\max }+r_{v}^{\min }\right)}{2}=0.723 \mathrm{AU}
$$

f) Eccentricity could be calculated from both of aphelion and perihelion distances as

$$
e=\frac{r_{v}^{\max }-r_{v}^{\min }}{2 a}=6.92 \times 10^{-3}
$$

Table 2.2

| Column 1 | Column 2 | Column 3 |
| :---: | :---: | :---: |
| Date | SVE <br> $\left({ }^{\circ}\right)$ | Sun - Venus Distance <br> (AU) |
| 2008-Sep-20 | 39.83 | 0.726 |
| 2008-Oct-10 | 47.16 | 0.728 |
| 2008-Oct-20 | 50.80 | 0.728 |
| 2008-Oct-30 | 54.55 | 0.728 |
| 2008-Nov-09 | 58.26 | 0.728 |
| 2008-Nov-19 | 62.10 | 0.728 |
| 2008-Nov-29 | 66.17 | 0.727 |
