$\mathrm{HCO}_{3}{ }^{-}$is the major species in solution.

The pH of the solution can be estimated as $\mathrm{pH}=\left(\mathrm{p} K_{\mathrm{a} 1}+\mathrm{p} K_{\mathrm{a} 2}\right) / 2=(3.65+10.33) / 2=6.99 \approx 7.00$, where $K_{\mathrm{a} 1}$ and $K_{\mathrm{a} 2}$ are the dissociation constants of $\mathrm{H}_{2} \mathrm{CO}_{3}$.

At pH 7.00 , both $\left[\mathrm{OH}^{-}\right]$and $\left[\mathrm{H}^{+}\right]$can be neglected. Besides, $\left[\mathrm{CO}_{3}{ }^{2-}\right] \ll\left[\mathrm{HCO}_{3}{ }^{\text { }}\right]$ (from 6-1)

Alkalinity $=\left[\mathrm{HCO}_{3}{ }^{-}\right]+2\left[\mathrm{CO}_{3}{ }^{2-}\right]+\left[\mathrm{OH}^{-}\right]-\left[\mathrm{H}^{+}\right] \approx\left[\mathrm{HCO}_{3}{ }^{-}\right]$

& \mathrm{~K}=\mathrm{k}_{\mathrm{f}} / \mathrm{k}_{\mathrm{b}}=\left(\mathrm{C}_{\mathrm{U}}\right)_{\mathrm{eq}} /\left(\mathrm{C}_{\mathrm{N}}\right)_{\text {eq }} \\
& 1 / K=k_{b} / k_{f}=\left(C_{N}\right)_{\text {eq }} /\left(\mathrm{C}_{\mathrm{U}}\right)_{\text {eq }} \\
& \equiv \quad \mathrm{k}_{\mathrm{b}} / \mathrm{k}_{\mathrm{f}}+1=\left(\mathrm{C}_{\mathrm{N}}\right)_{\mathrm{eq}} /\left(\mathrm{C}_{\mathrm{U}}\right)_{\mathrm{eq}}+1 \\
& \equiv \quad\left(\mathrm{k}_{\mathrm{b}}+\mathrm{k}_{\mathrm{f}}\right) / \mathrm{k}_{\mathrm{f}}=\left[\left(\mathrm{C}_{\mathrm{N}}\right)_{\mathrm{eq}}+\left(\mathrm{C}_{\mathrm{U}}\right)_{\text {eq }}\right] /\left(\mathrm{C}_{\mathrm{U}}\right)_{\text {eq }} \\
& \equiv \quad\left(k_{b}+k_{f}\right) / k_{f}=C /\left(C_{U}\right)_{e q} \\
& C=\left[\left(k_{b}+k_{f}\right)\left(C_{u}\right)_{e q}\right] / k_{f} \tag{2}
\end{align*}
$$

Now substitute $C$ obtained from eq2 to eq1.

We get $\quad k_{f}\left\{\left[\left(k_{b}+k_{f}\right)\left(C_{u}\right)_{e q}\right] / k_{f}\right\}-\left(k_{f}+k_{b}\right) C_{u}$

$$
\begin{array}{ll}

\equiv> & -\left(k_{f}+k_{b}\right)\left[C_{u}-\left(C_{u}\right)_{e q}\right]
\end{array}
$$

So we get
$d C_{u} / d t=-\left(k_{f}+k_{b}\right)\left[C_{u}-\left(C_{u}\right)_{e q}\right]$
